

# Multi-Messenger Astronomy with Rubin Telescope

Silvia Piranomonte

INAF

## Time Line

**2019** named "Legacy Survey of Space and Time" of the  
"Vera C. Rubin Observatory"

**2025 System First Light** ⇨ commissioning and science  
verification

**2-3 months after System First Light** ⇨ First data preview  
release (DP1)

**4-7 months after System First Light** ⇨ LSST Survey start

**9-12 months after System First Light** ⇨ Data Preview 2  
(DP2)

**12-14 months after LSST Survey** ⇨ Data Release 1 (DR1)

**Cerro Pachón**

(Monthly updates on <https://www.lsst.org/about/project-status>)

## Rubin telescope: some key numbers

Nightly data size: 20 TB/night  
Final database size (DR11) : 15 PB  
Number of objects (full survey, DR11): 20B galaxies  
17B resolved stars  
6M orbits of solar system bodies

Primary mirror diameter : 8.4 m  
Field of View : 9.6 square degrees  
Focal plane : 189 4kx4k science CCD chips, 0.2 arcsec/pixel  
Survey duration : 10 years  
Number of visits: ~2.1 million  
Six filters: u g r i z y

Ivezic et al. (2019, ApJ, 873, 111)

# Survey Cadence

**Observing strategy still to be finalised according to inputs from the scientific community**

(see [ApJ Supplement Series focus issue on Rubin LSST Survey Strategy Optimization](#))

## Wide Fast Deep (WFD)

**main survey - about 20000 deg<sup>2</sup> ~90% of time  
2-3 visits of the same field in the same night,  
then after ~3 days when all filters are  
considered (after 1-3 weeks in the same filter)**

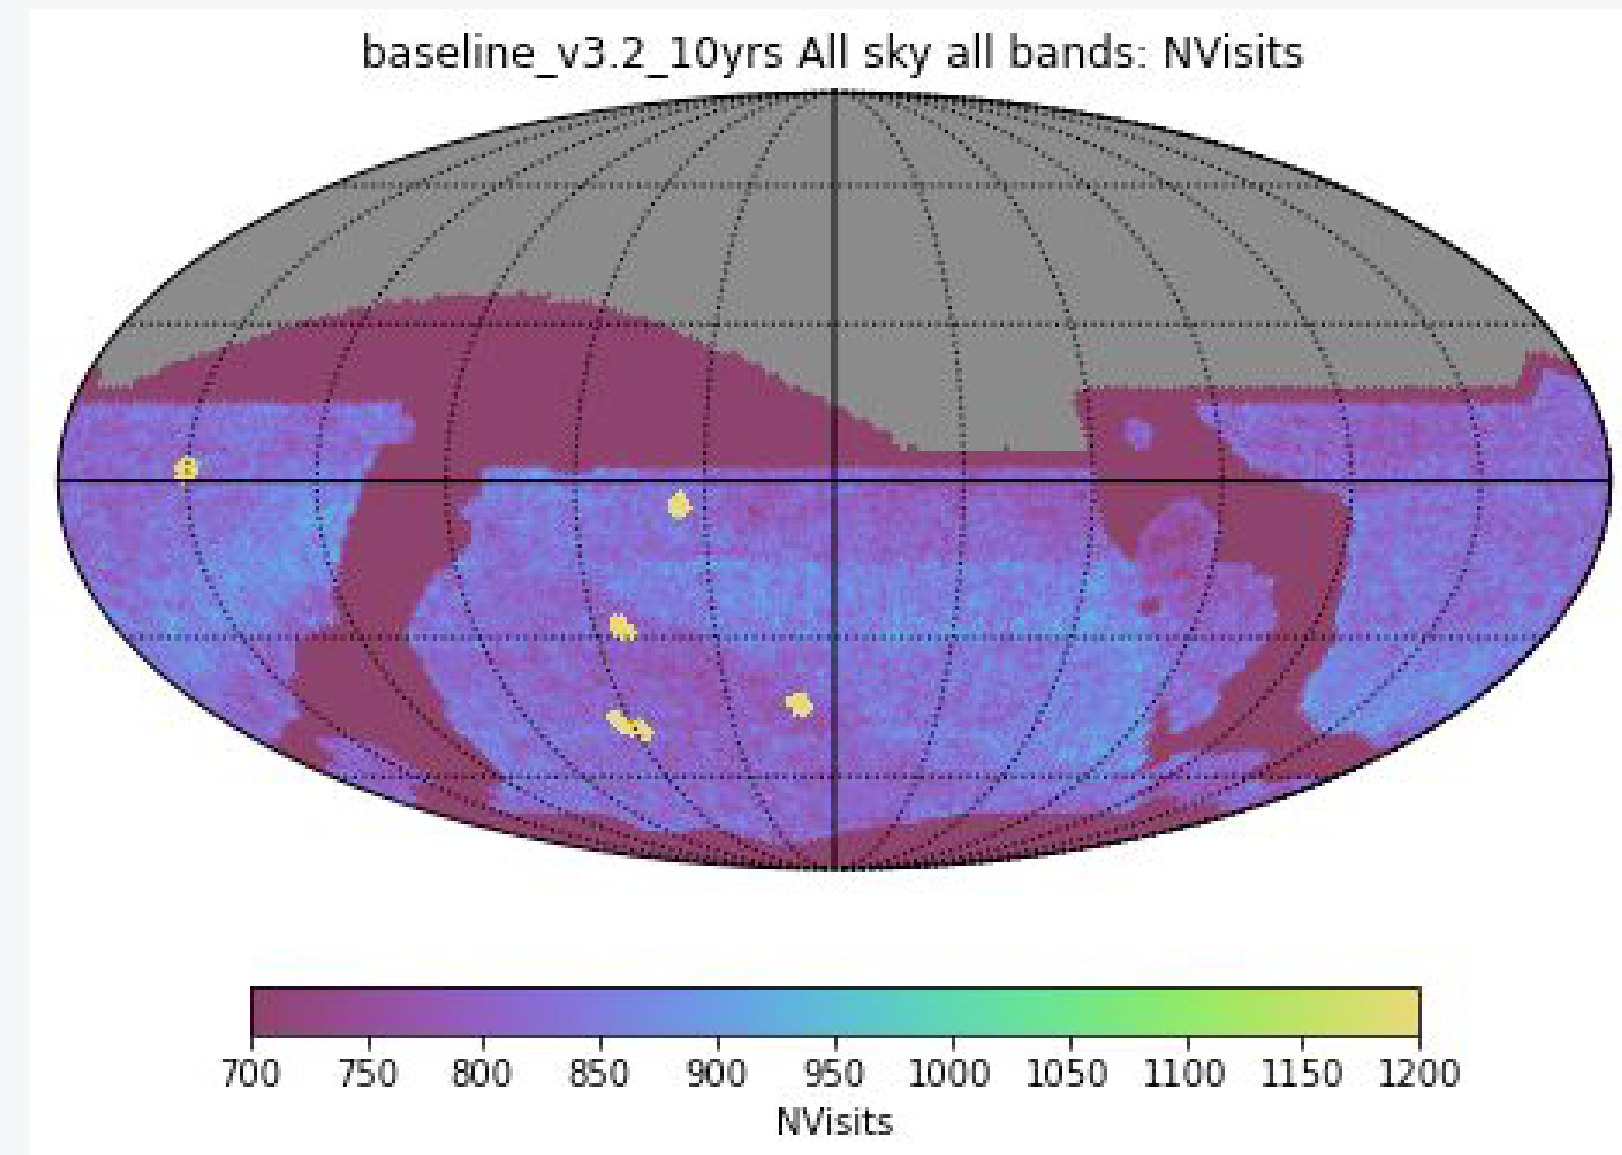

## Deep Drilling fields (DDF)

**~7% of time; 5 fields (1 double), 9.6 deg<sup>2</sup> each**

## Near-Sun Twilight Microsurvey

**~1% of time, early microsurvey to improve  
recovery of interior-to-Earth asteroids**

## Possible other mini/micro surveys

# Survey Depth

Single image  $5\sigma$  depths in  
u, g, r, i, z, y:

23.9, 25.0, 24.7, 24.0, 23.3, 22.1

## Wide Fast Deep (WFD)

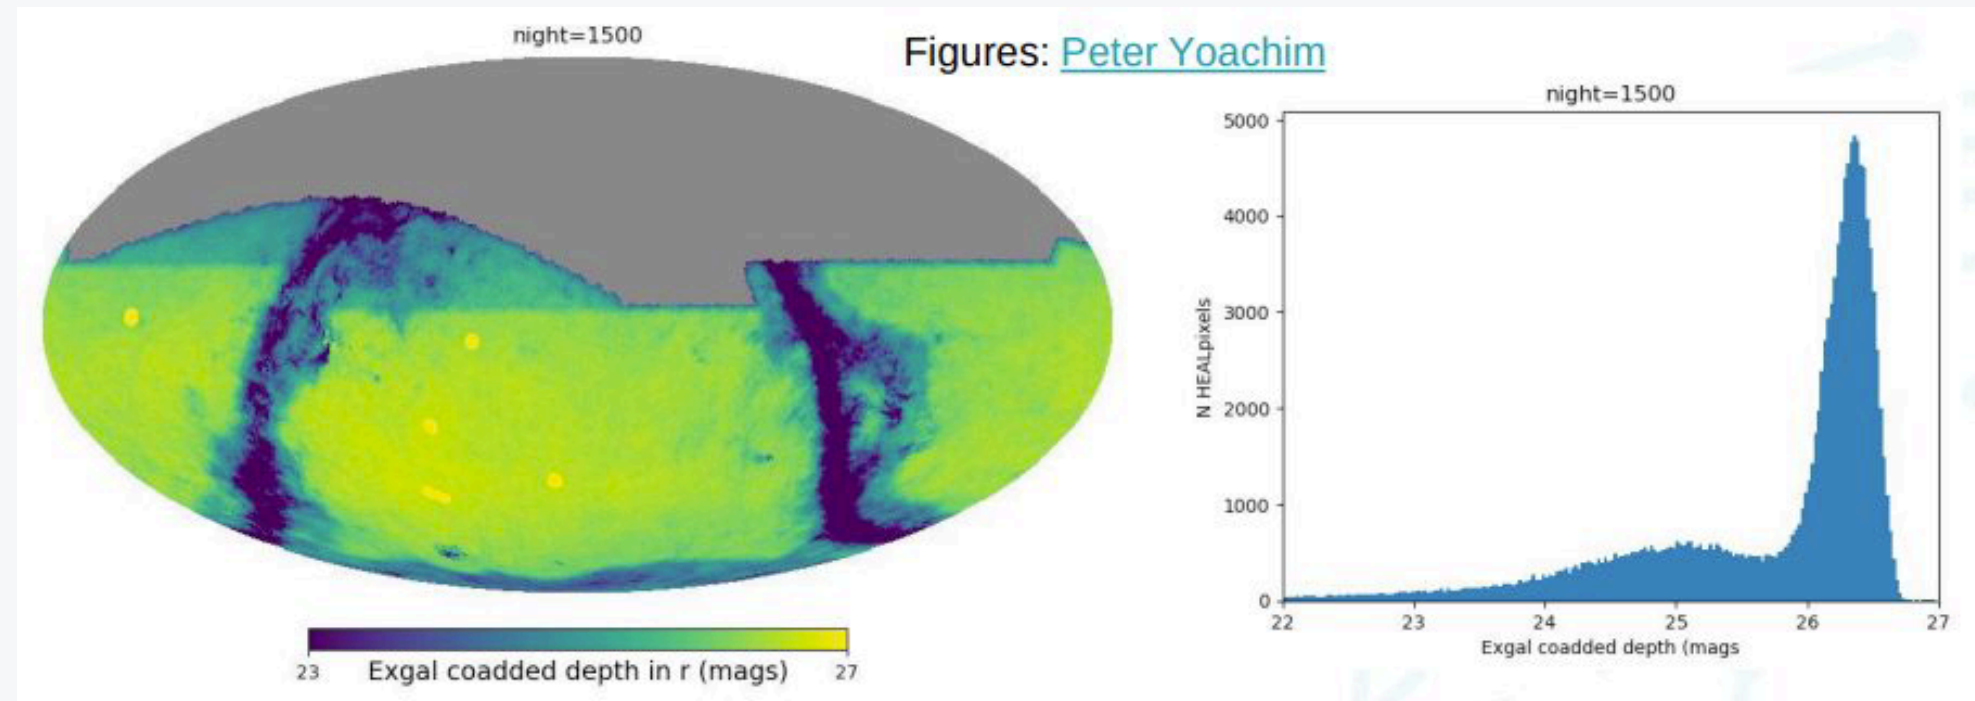

10 yr coadded image stack  $5\sigma$   
depths in u, g, r, i, z, y:

26.1, 27.4, 27.5, 26.8, 26.1, 24.9

## Deep Drilling Fields (DDFs)

10 yr coadded image stack  $5\sigma$  depths in  
u, g, r, i, z, y:

28-28.5, 28.7, 28.9, 28.4, 28.0, 27.0

From Buchanan 2023 and Mendoza 2023 - presentations at the 2023  
Project & Community Workshop

# Target of opportunity observations with Rubin

(less than 3% of survey time)

1. Gravitational Waves and Multi-Messenger Astronomy

2. High-Energy Neutrinos

3. Galactic Supernova

4. Small PHA Potential Impactor

KM3NeT,  
Mediterranean Sea

Virgo, Italy

Einstein Telescope

LIGO, USA

IceCube, South Pole

**Up to 10 million alerts, 20 TB of  
data...every night!**

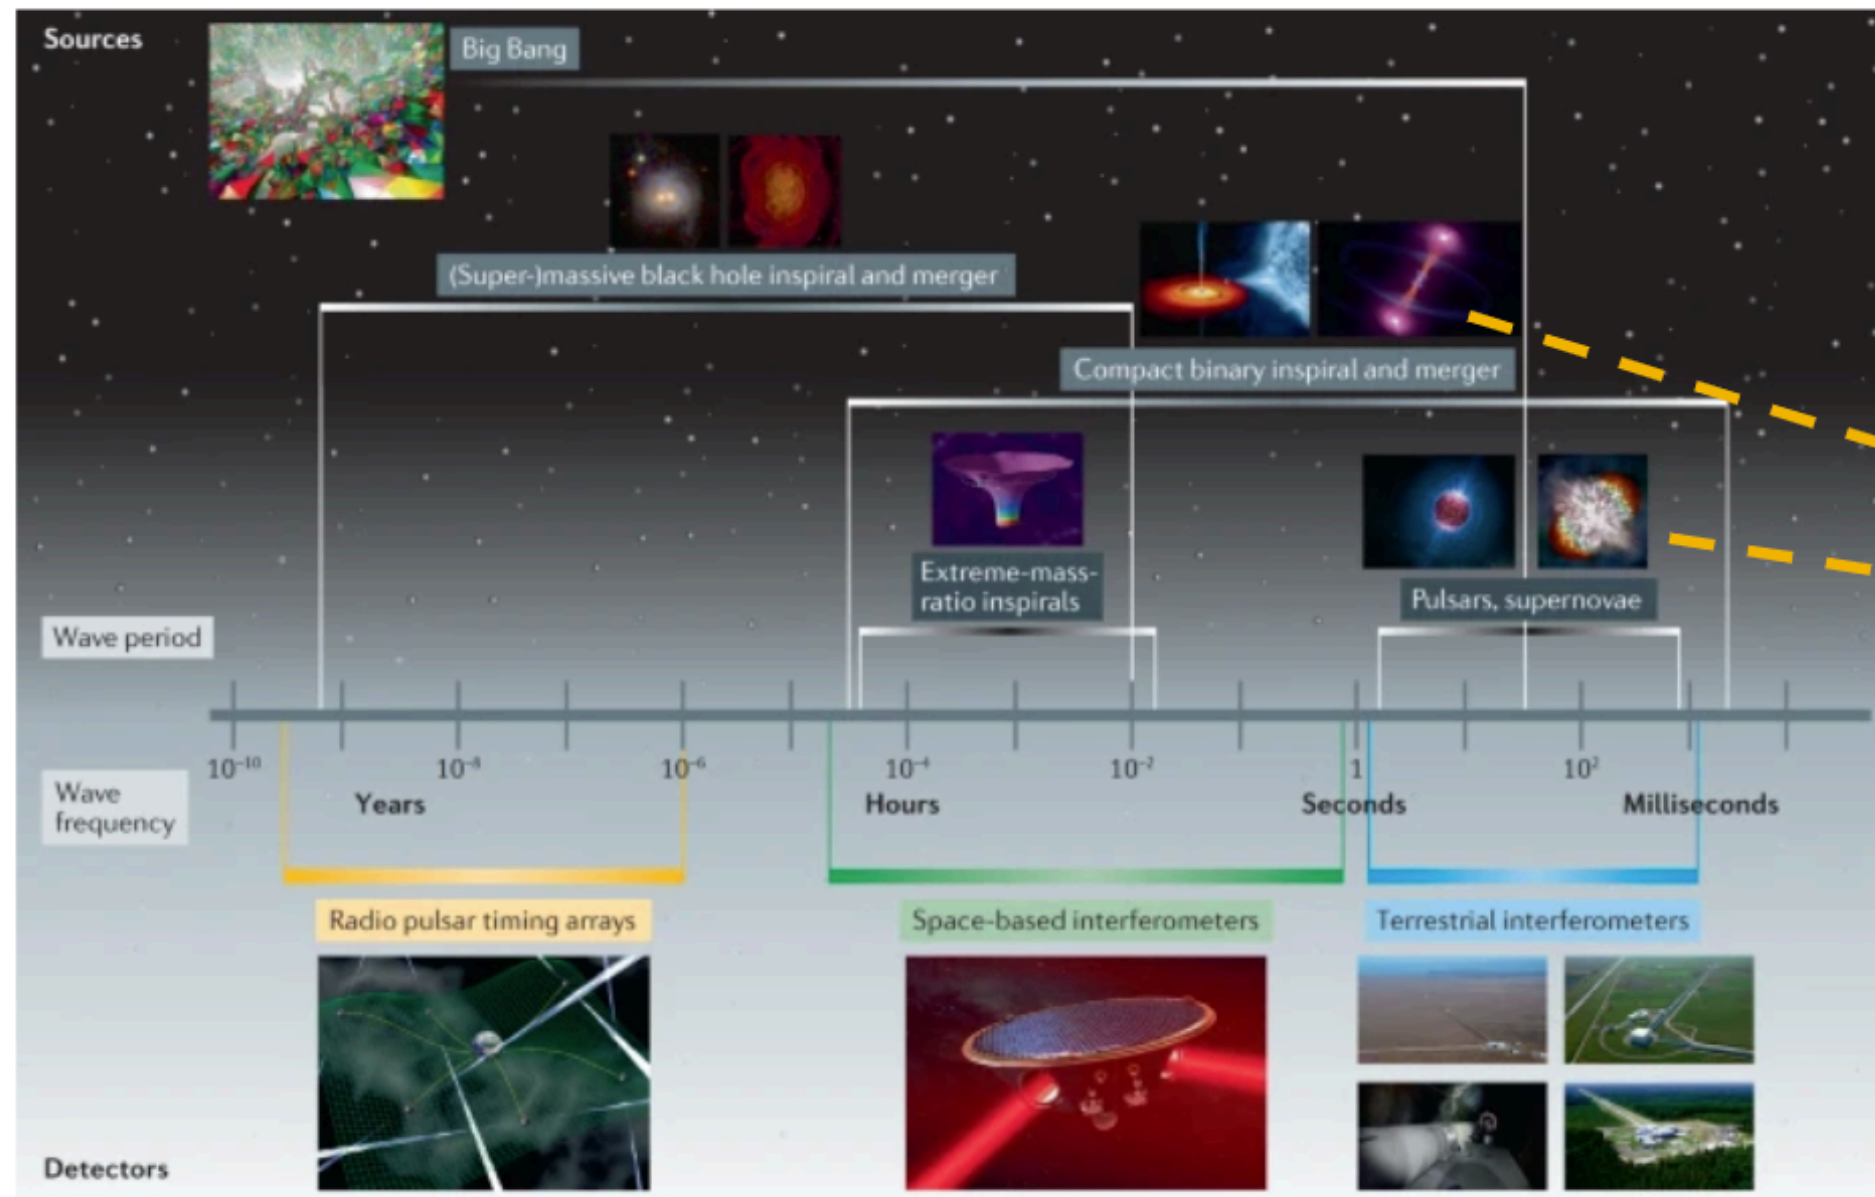

**Science Collaborations (SCs)**

- Galaxies
- Stars, Milky Way & Local Volume
- Solar System
- Dark Energy
- Active Galactic Nuclei
- Transient/Variable Stars
- Strong Lensing
- Informatics & Statistics

# WHY RUBIN

## Rubin TVS - Multi-wavelength and GW follow-up sub-group

coordinator: Raffaella Margutti, Berkley, USA

- **Rubin as a (ToO) follow-up machine** -> sources from GW detectors
- **Rubin as a discovery machine** -> follow-up from other facilities

Gravitational-wave physics and astronomy in the 2020s and 2030s, Nature Reviews Physics

**(Key Challenge: Limited resources for multi-wave follow-up vs. number of LSST transients)**

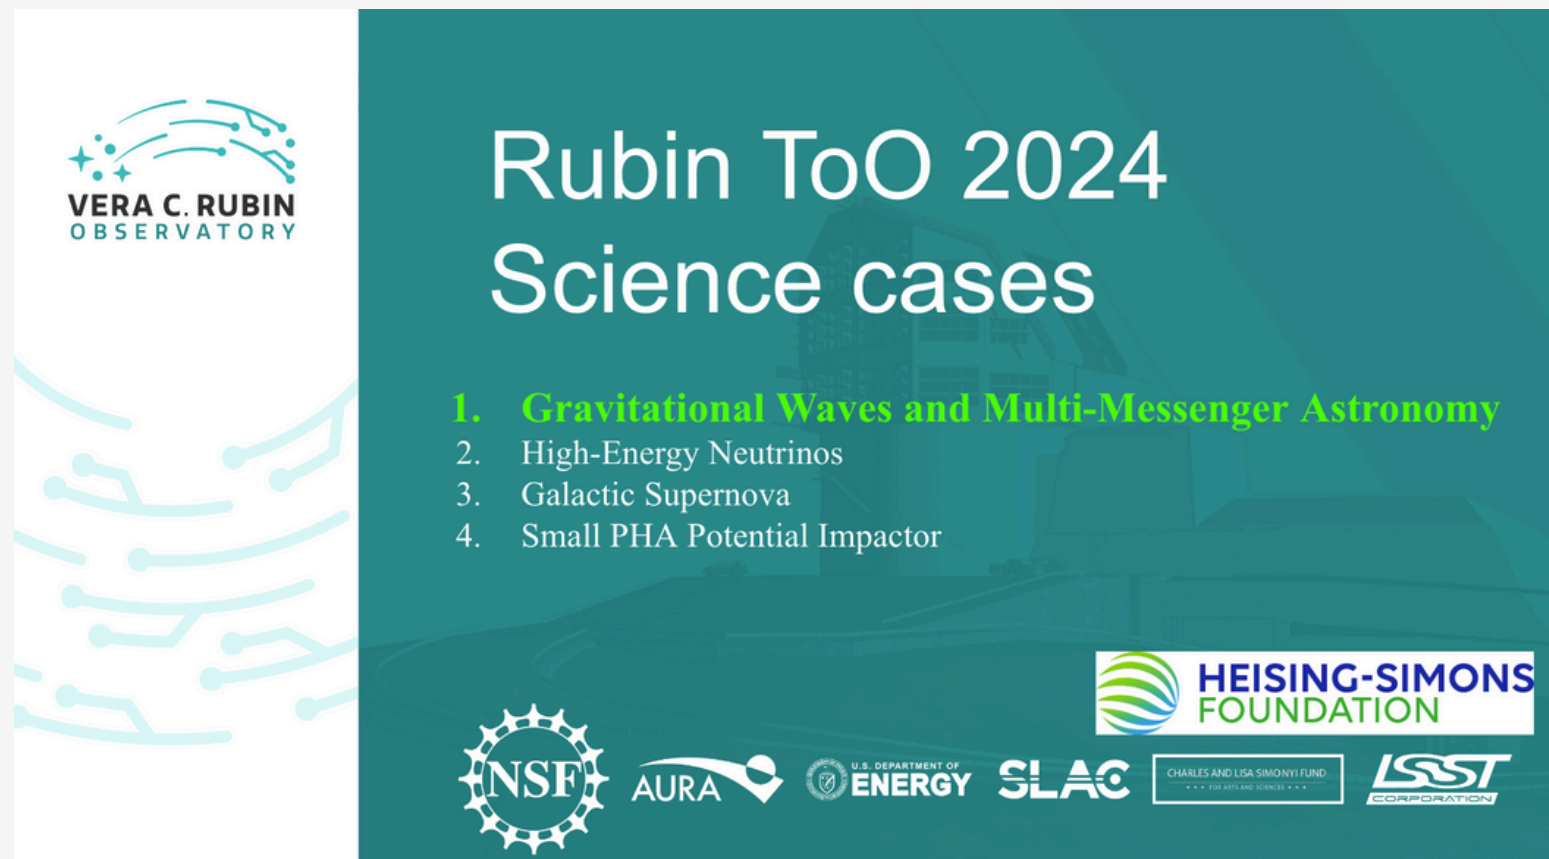

# WHY RUBIN

Rubin as a (ToO) follow-up machine

## Multi-Messenger Astronomy: Gravitational Waves Science Case Motivation

Igor Andreoni, Raffaella Margutti

The poster features the Vera C. Rubin Observatory logo at the top left. The main title is 'Rubin ToO 2024 Science cases'. Below the title is a numbered list of science cases. At the bottom, there are logos for NSF, AURA, U.S. Department of Energy, SLAC, Heising-Simons Foundation, Charles and Lisa Simonini Fund, and LSST Corporation.

**VERA C. RUBIN OBSERVATORY**

### Rubin ToO 2024 Science cases

- 1. Gravitational Waves and Multi-Messenger Astronomy**
2. High-Energy Neutrinos
3. Galactic Supernova
4. Small PHA Potential Impactor

**NSF** **AURA** **U.S. DEPARTMENT OF ENERGY** **SLAC** **HEISING-SIMONS FOUNDATION** **CHARLES AND LISA SIMONINI FUND** **LSST CORPORATION**

#### Gravitationally lensed Binary Neutron Star mergers

*Science case lead: Graham Smith*

#### Black Hole-Black Hole Mergers

*Science case lead: Antonella Palmese*

#### Unidentified GW Sources

*Science case lead: Ryan Chornock*

#### Emerging Ideas Science Case: Gravitationally lensed Gamma-Ray Bursts and their afterglows

*Science case lead: Graham Smith*

April, 18 2024: report sent to the SCOC (Survey Cadence Optimization Committee)

# WHY RUBIN

## NS-NS / NS-BH mergers: what do we expect to see ?

(the merger scenarios lead to the a central engine (rapidly accreting BH surrounded by a massive disc able to launch a jet)

### ★ Collimated EM emission from Short GRBs

Brief, intense flash of gamma-ray radiation with a detectable X-ray/UV/**OPTICAL**/IR/radio counterpart (afterglow)

**Fast:** from few ms to hundreds of s  
**Energetic:**  $10^{-7} - 10^{-3} \text{ erg cm}^{-2}$   
**Bright:**  $10^{-8} - 10^{-4} \text{ erg cm}^{-2} \text{ s}^{-1}$

### ★ Optical/NIR isotropic emissions: Kilonova

r-process

Nucleosynthesis of heavy nuclei

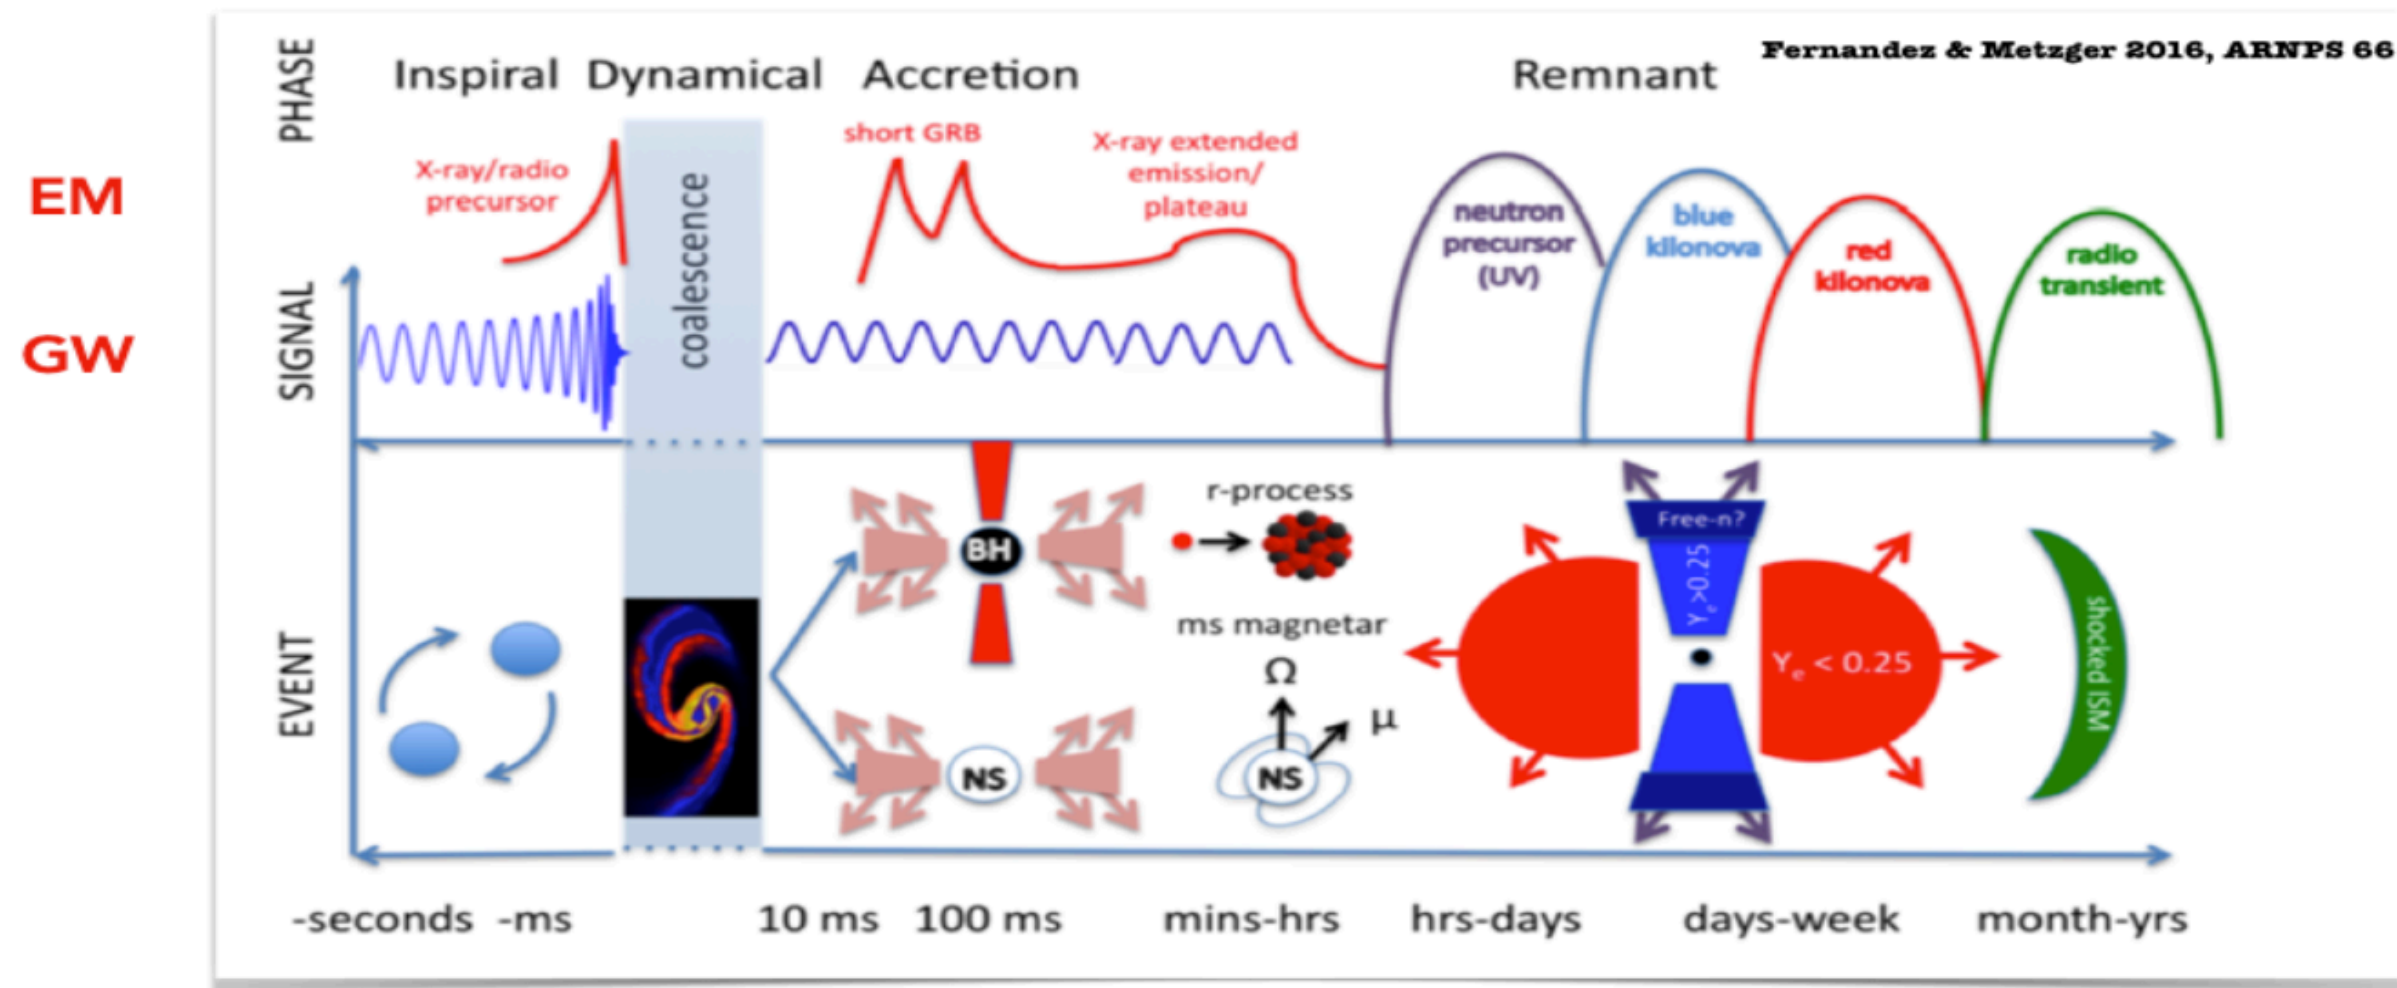

Radioactive decay of heavy elements

# WHY RUBIN

NS-NS / NS-BH mergers: what do we expect to see?

## NS-NS NS-BH Merger: a global picture

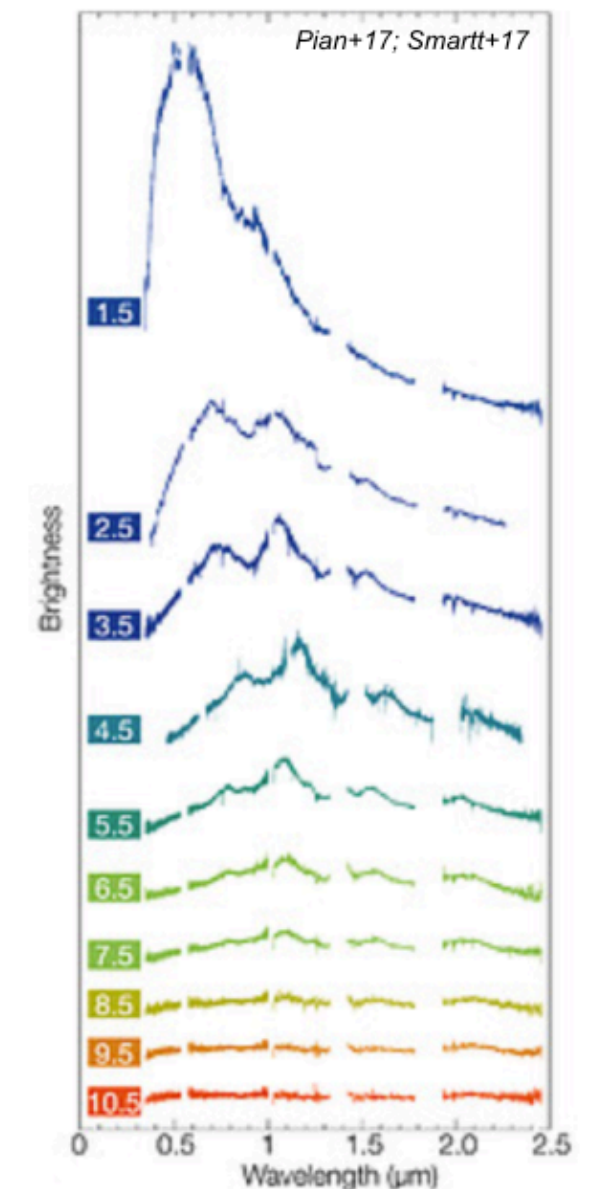

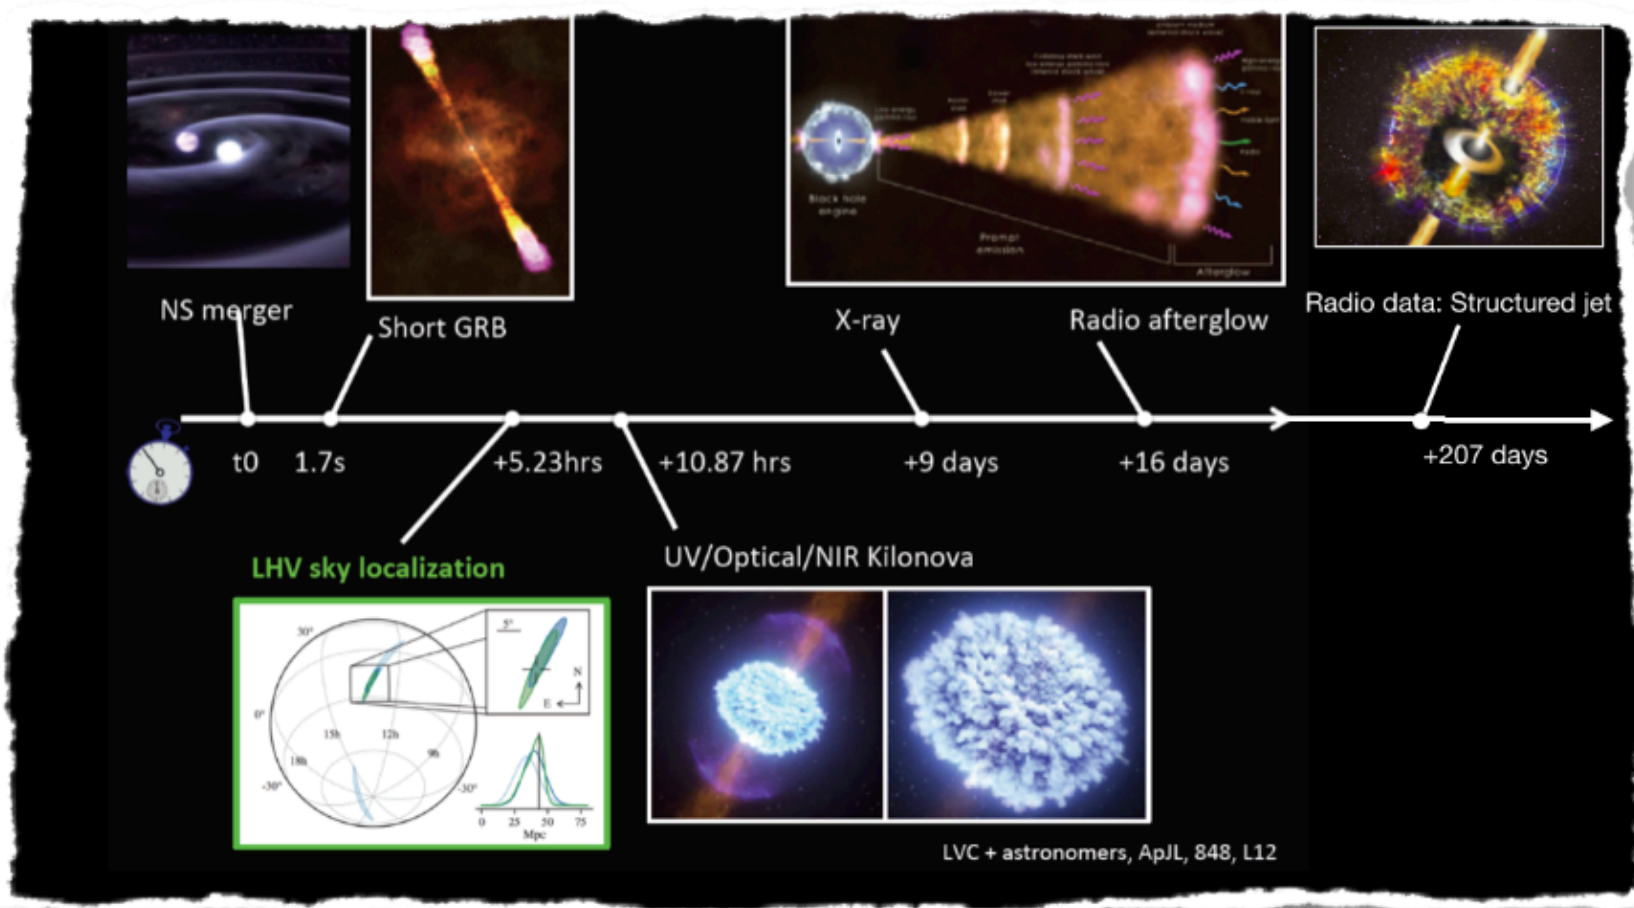

Request for network of multi-wavelength observatories which **cover huge region** of the sky, **get on target promptly**, **repeat** observations over different timescales and **go deep**

# WHY RUBIN

NS-NS / NS-BH mergers: what do we expect to see?

## GW170817 - GRB170817: the game changer

We have seen the light !!

# WHY RUBIN

Follow-up strategy (not an easy game)

**large sky maps, faint targets**

Rubin tiling of simulated GW skymaps for NS–NS mergers

Sky maps from GW detections can be 100s to 1000s square degrees.

We will limit ourselves to, roughly,  $\Omega \lesssim 100$  square degrees

We will (still) need a large field of view for efficient observations

**COVER HUGE REGION**

Andreoni et al. 2022

# WHY RUBIN

## Justification for the use of Rubin

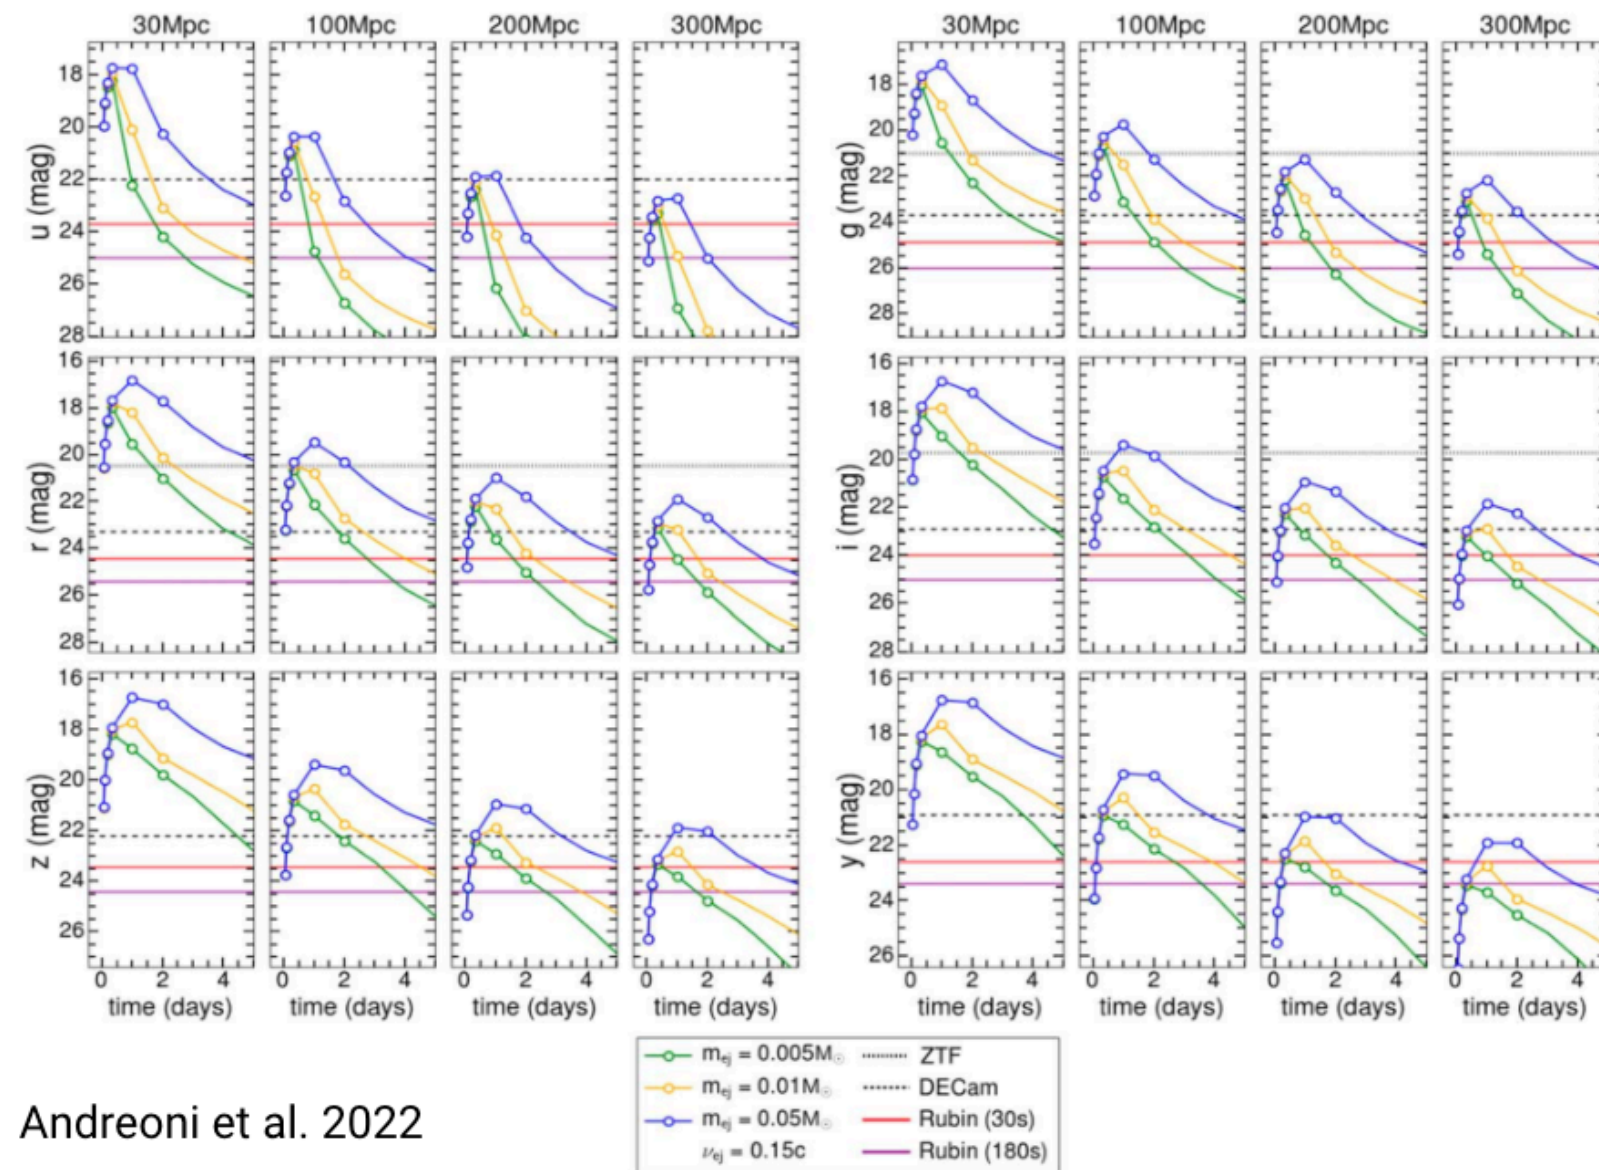

Filter	Depth (AB mag)			$M$ (350 Mpc)			$M$ (700 Mpc)			Exptime (sec)
$u$	24.9	24.7	23.9	-12.8	-13.1	-13.8	-14.4	-14.6	-15.3	180 - 120 - 30
$g$	26.0	25.8	25.0	-11.7	-12.0	-12.7	-13.3	-13.5	-14.2	180 - 120 - 30
$r$	25.7	25.5	24.7	-12.0	-12.3	-13.0	-13.6	-13.8	-14.5	180 - 120 - 30
$i$	25.0	24.8	24.0	-12.7	-13.0	-13.7	-14.3	-14.5	-15.2	180 - 120 - 30
$z$	24.3	24.1	23.3	-13.4	-13.7	-14.6	-15.0	-15.2	-15.9	180 - 120 - 30
$y$	23.1	22.9	22.1	-14.6	-14.9	-15.6	-16.2	-16.4	-17.1	180 - 120 - 30

**Table 1:** The 30-second 5-sigma depths are taken from [Bianco et al., 2022](#) (in orange). The absolute magnitudes in each filter are given at two reference distances (350 Mpc and 700 Mpc). These depths are scaled to 120s and 180s assuming we are background limited. Relevant exposure times are provided for those absolute magnitudes.

# WHY RUBIN

## large sky maps, faint targets

Simulated KN light curves in the six Rubin filters for different properties of the ejecta (mass and velocity) at four representative distances (30, 100, 200, and 300 Mpc)

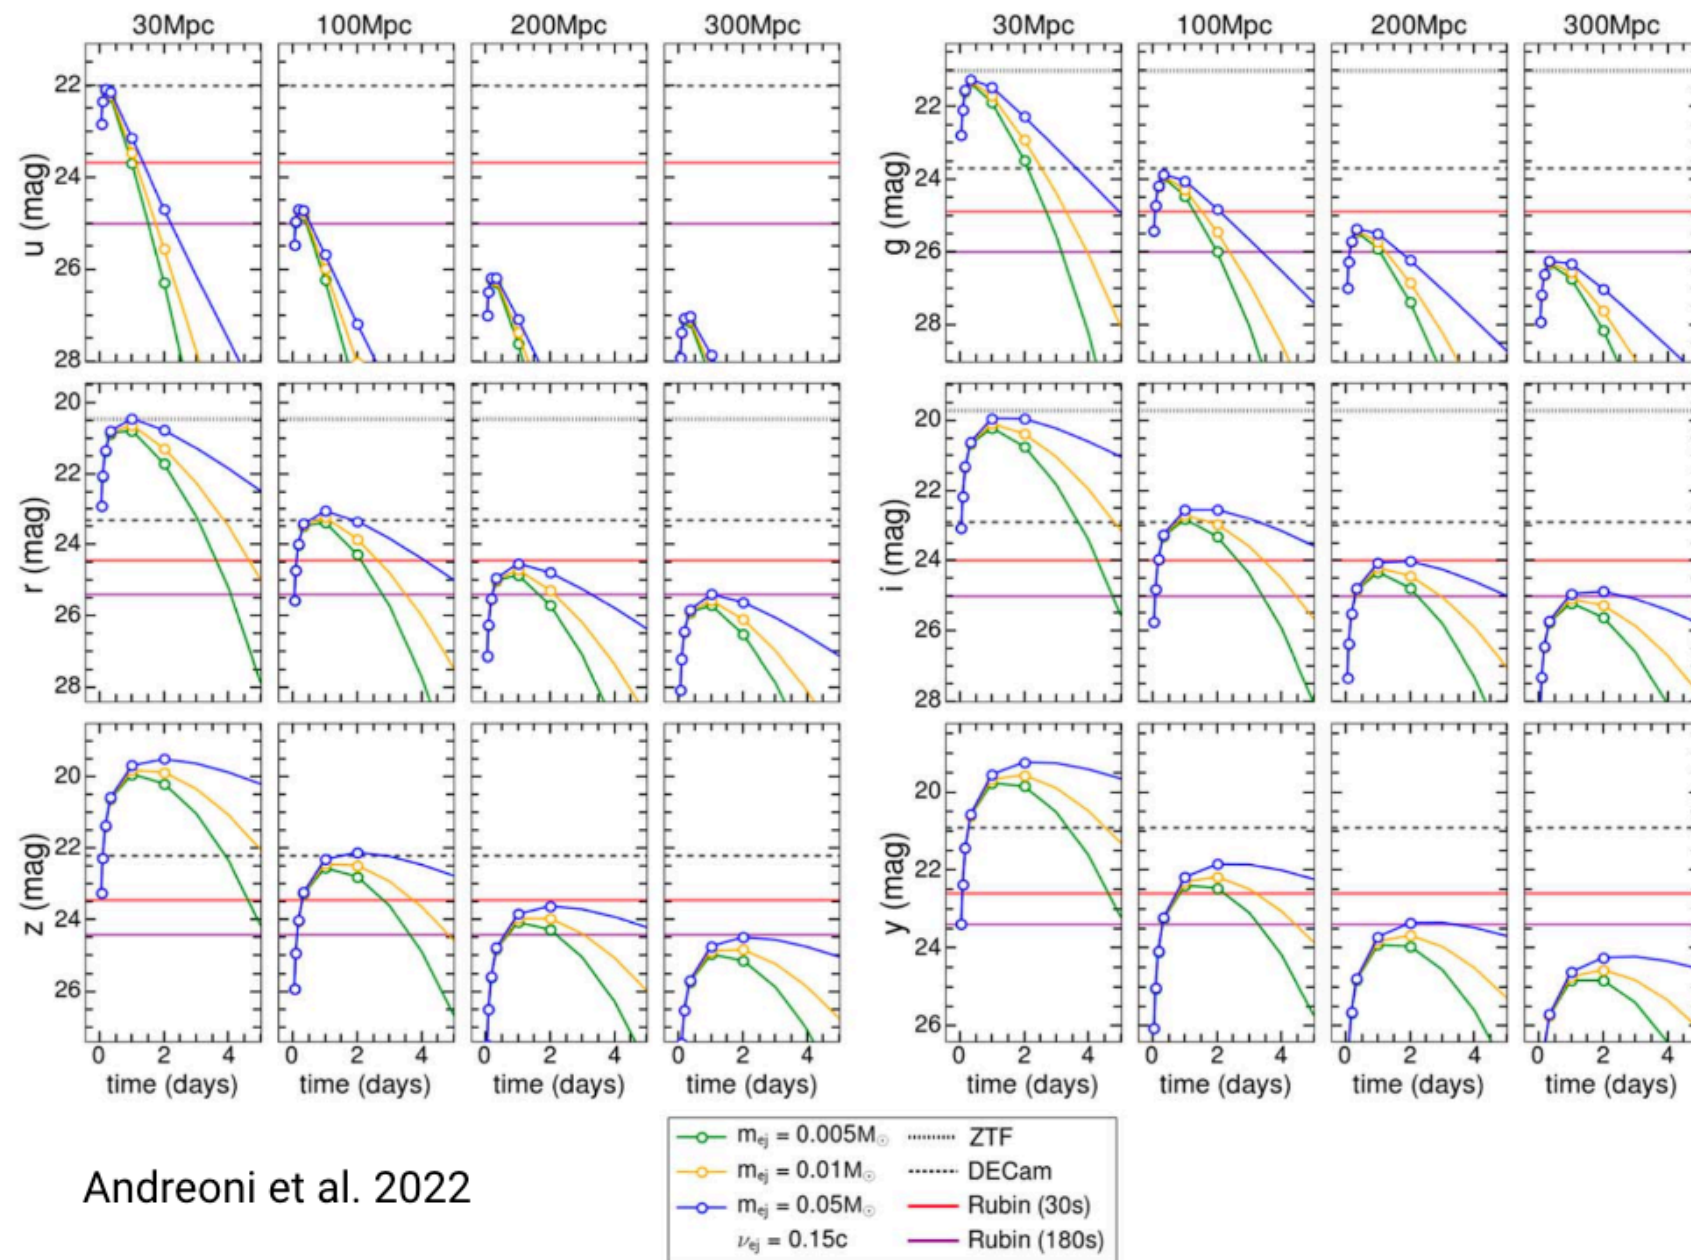

Andreoni et al. 2022

**GET ON TARGET PROMPTLY and deep**

- “Blue” and luminous kilonovae
- Optimistically, DECam (and potentially Pan-STARRS) could reach the sources
- But this is optimistic ***and*** we will need to go  $\sim 1$  mag deeper to see a rapid fade and reduce false positives

# WHY RUBIN

## Large sky maps, faint targets

Andreoni et al. 2022

- “Red” and faint kilonovae
- Impossible with any other facility than Rubin
- In reality - quite possible true candidates will be somewhere in between

**Rubin is gold!  
Essential, unique and  
game changing facility in this  
area**

# WHY RUBIN

## What is the frontier after GW170817?

### EM counterparts of GW sources studies with Rubin LSST

- Kilonovae (KN)  
**Blue** component  
+ discovery of  
new emission  
components

- Population studies:  
mapping the diversity  
of binary neutron star  
(BNS) merger  
outcome

- Discovery of a EM counterparts of a  
BH-NS merger

- EM counterparts of BH-BH  
merger or lensed BNS

● get on target promptly!

● go deep (over the entire LVK  
localization region)!

# WHY RUBIN

## Immediate goals for Rubin - LVK O5 updated

### LVK Observing Plan

Our case will focus specifically on what we can achieve in O5.

We are not (yet) proposing a strategy for 10 years of lifetime of Rubin.

### Rates of BNS and NSBH detections still very uncertain

$$R_{\text{BNS}} = 98^{+260}_{-85} \text{ Gpc}^{-3} \text{ yr}^{-1} \text{ (LVK, binned GP model ; N. Sarin)}$$

$$\text{Naive estimate: } R_{\text{BNS}} = 19^{+33}_{-18} \text{ yr}^{-1} \text{ (rate of production of BNS by the Universe)}$$

$$\text{Shah et al. 2024: } R_{\text{BNS}} = 17^{+22}_{-10} \text{ yr}^{-1}$$

# WHY RUBIN

## How many BNS and NSBH might we expect to occur in O5?

all sky

Sky area $\Omega$ (sq deg)	Median number of BNS	90% confidence range of BNS with maps $< \Omega$ /year	90% confidence range of NS-BH with maps $< \Omega$ /year
50	14	6-31	0 - 3
100	18	8-41	1 - 4
150	20	9-45	1 - 5
250	25	11-56	1 - 7
500	32	14-70	2 - 9
1000	37	17-83	2 - 11

Table 2: Projected ranges of the number of BNS and NS-BH mergers in O5 (90% confidence) with the expected sky map size. The ranges highlight the current uncertainty in rates and projected detector performance in O5. In the rest of this document, we base our time ToO recommendation on the median number from the calculation described in the text.

with Rubin

roughly  $\frac{1}{3}$  of  
the events in  
Table 2 are  
available for  
immediate  
Rubin  
observing.

Event rate (triggers/year): calculated by Shreya Anand at the meeting, with SNR > 12

Calculated using information from the official LVK observing scenarios study ([Kiendrebeogo et al., 2023](#))

Note this was before the recent update on Virgo, and assumed distance range DBNS for Virgo was ~150 - 240 Mpc

# Data policy

Alerts on variable objects publicly available 60 secs after image acquisition through 7 selected full-stream Alert Brokers (software systems that ingest and process the data and publish alerts) and 2 downstream Alert Brokers. Expected about 10 million alerts per night! (Graham et al. 2020, DMTN-102)

## 11 Data Releases

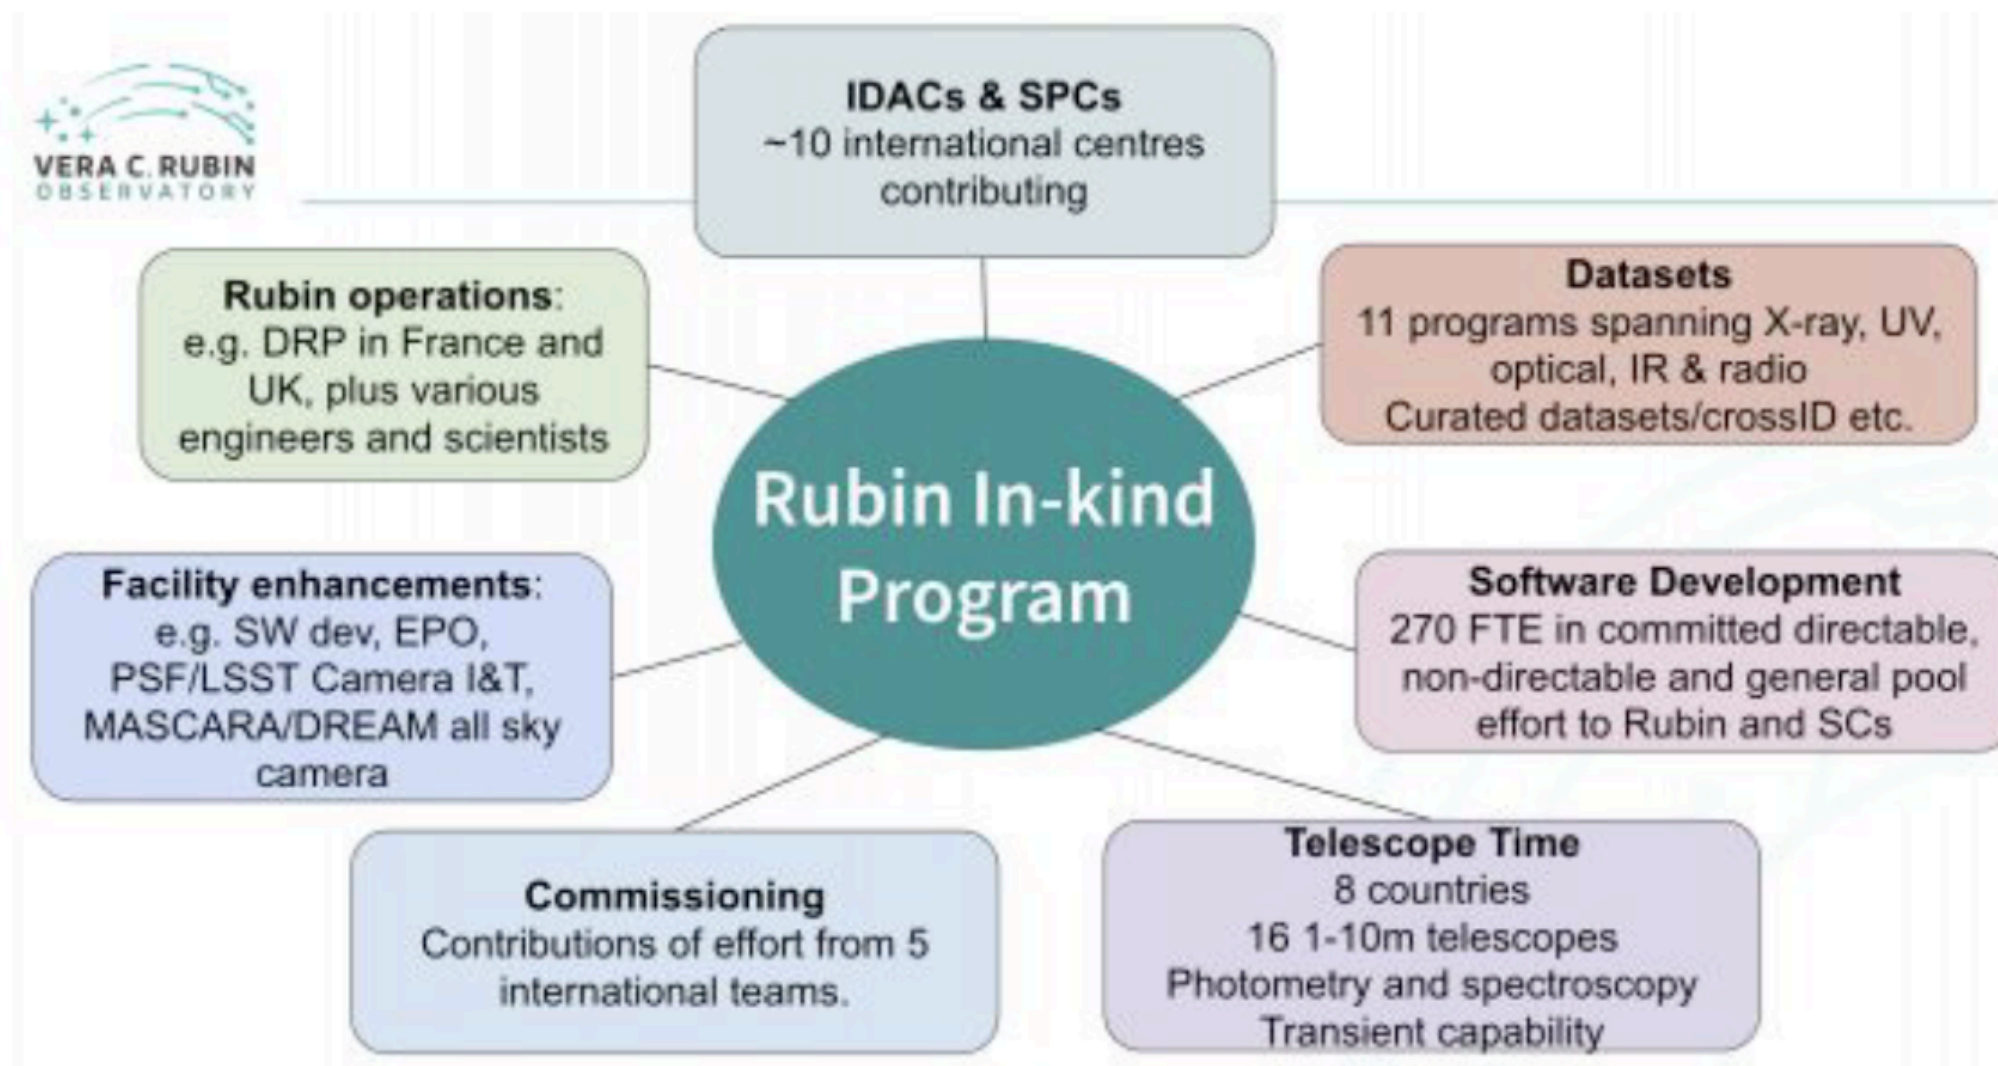

Data will become public after 2 years from the release for which they are associated.

## BUT

Prompt access to full Rubin-LSST data possible through the Rubin Science Platform (RSP) for data right holders.

Data rights are guaranteed to scientists in US and Chile, while international partners must provide **in-kind contributions**.

153 in-kind contributions from 43 teams in 30 countries.

# WHY RUBIN

## Total BNS+NS-BH summary recommendation for the whole of O5

Type	Skymap size	Number of triggers	Time per trigger	Total
Gold (3-filter+deep)	100	16	9 hrs	144 hrs
Silver	500	6	16 hrs	96 hrs
<b>Grand total</b>				<b>240 hrs</b>

**Table 3:** Total Summary recommendation for BNS and NS-BH during the LVK O5 run

Note on the 3% ToO Rubin Time budget :

Assume these triggers happen between start of Rubin and end of 2029 (4 years of Rubin operations)

3% of Rubin open shutter, science time, has been estimated at 50-60 hrs per year.

Hence our request is consistent with the 3% budget that the Rubin Observatory may allocate to ToOs

# WHY RUBIN

## What would be our trigger criteria for Rubin ?

### Trigger Criteria

- *Only trigger on an Initial map, do not trigger on Preliminary<sup>6</sup>*
- *The probability of being BNS or NS-BH should be greater than 90%: **BNS+NS-BH**  $\geq 0.9$*
- *False alarm rate less than 1 per 1 year: **FAR**  $< 1.6e-08$  Hz*
- *90% sky area less than 500 square degrees (then we consider one of the two scenarios below):  $\square < 500$*
- *For NS-BH events, require that there is a good probability that mass has been ejected (these numbers will be changed based on O4 results and O5 projections): **HasNS**  $\geq 0.5$  and **HasRemnant**  $\geq 0.5$ , which correspond to the probability that at least one of the two merging objects is a neutron star and the probability that the system ejected a non-zero amount of neutron star matter<sup>7</sup>, respectively.*

# Rubin-LSST = DISCOVERY machine
