

Update on drilling campaigns 2024 and 2025 ET EMR

Between March 2024 and January 2025, 11 boreholes got cored between 250 - 400 m depth. The total cored depth amounted to about 3600 meters. Four boreholes were finalized as a deep seismometer station, the others as deep piézometer stations. The subsurface team is still analysing the results of the boreholes and existing geophysical data. Some preliminary findings about the geological structures will be shared.
